When the mind is the battlefield, defeat is not the end of the road. The opportunity to come back remains as long as the mind remains alive.

حينما يكون العقل هو ساحة المعركة، فإن الهزيمة ليست نهاية المطاف، الفرص للعودة تظل قائمه طالما بقي العقل علي قيد الحياة

Abdou El-Sharkawy

Assistant professor and chairman of anatomy and embryology department , faculty of medicine , Al-Azhar university in Cairo , Egypt.

With me, and on this table that holds human cadaver specimens, and inside this department, you will transform from an ordinary person into a physician.

We do not merely provide knowledge, but rather we provide practice and training that will qualify you with distinction to receive all other medical sciences. In addition to anatomy being the foundation of medicine, and to the fact that you will learn with us every structure of the human body, you will — compared to any other medical specialty, whether academic or clinical — see with your own eyes and touch with your own hands everything you have learned with us. This will be a journey that will take a period of time equivalent to half of the entire program duration.

It is a journey that has an end, after which there will be no more teaching and assessment, but it will leave a foundational impact that will remain with you and influence your level of professionalism throughout your professional future as a physician.

Welcome to the Department of Anatomy and Embryology
Dr. Abdo El-Sharkawy
Associate Professor and Head of the Department of Anatomy and Embryology

معي ، وعلي هذه الطاوله التي تحمل عينات الجثث الآدميه وداخل هذا القسم ستتحول من شخص عادي الي طبيب،

نحن لا نقدم علماً، بل نقدم ممارسه وتدريب يؤهلك بجداره لتلقي كل علوم الطب الأخري، ففضلا عن كون التشريح هو أصل الطب ، وأنك ستتعلم معنا كل تراكيب الجسم الآدمي، فإنك وبالمقارنه مع أي تخصص طبي آخر أكاديمي أو إكلينيكي ستشاهد بعينك وتلمس بيدك كل ما تعلمته معنا في رحله ستستغرق من الزمن ما يكافئ نصف مده البرنامج بالكامل.

انها رحله لها نهايه لن يكون بعدها تدريس وتقييم ، لكن سيكون لها اثر بنائي سيبقي معك ويؤثر في مستوي إحترافيتك علي مدي مستقبلك المهني كطبيب .

أهلا بكم في قسم التشريح والأجنه

دكتور: عبده الشرقاوي

استاذ ورئيس قسم التشريح والأجنه

and its name comes from the Greek word anatomē which means to cut

Art of description of facts

The anatomical position

The standard anatomical position is the agreed-upon reference posture where the human body stands upright, faces forward, keeps arms at the sides with palms facing forward, and places feet parallel and flat on the ground

Key Posture Details:

Body: Standing straight and upright.

Head and Eyes: Facing forward with a neutral expression.

Arms: Hanging straight down by the sides.

Hands: Palms facing forward with thumbs pointing away from the body.

Legs and Feet: Close together or parallel, with toes pointing forward.

Why It Matters?

Universal Language: Prevents confusion when doctors talk about left, right, front, or back.

Directional Terms: Words like superior (above) and inferior (below) rely entirely on this stance.

Error Prevention: Helps surgical and medical teams stay aligned on exact treatment

Directional Terms

Directional terms describe the positions of structures relative to other structures or locations in the body.

Superior or cranial- toward the head end of the body; upper (example, the hand is part of the superior extremity).

Inferior or caudal - away from the head; lower (example, the foot is part of the inferior extremity).

Anterior or ventral - front (example, the kneecap is located on the anterior side of the knee joint).

Posterior or dorsal – back (example, the shoulder blades(scapulae) are located on the posterior side of the body).

Medial - toward the midline of the body (example, the big toe is located at the medial side of the foot).

Lateral - away from the midline of the body (example, the little toe is located at the lateral side of the foot).

Proximal - toward or nearest the trunk or the point of origin of a part (example, the proximal end of the femur joins with the pelvic bone).

Distal - away from or farthest from the trunk or the point or origin of a part (example, the hand is located at the distal end of the forearm).

Planes of the Body:

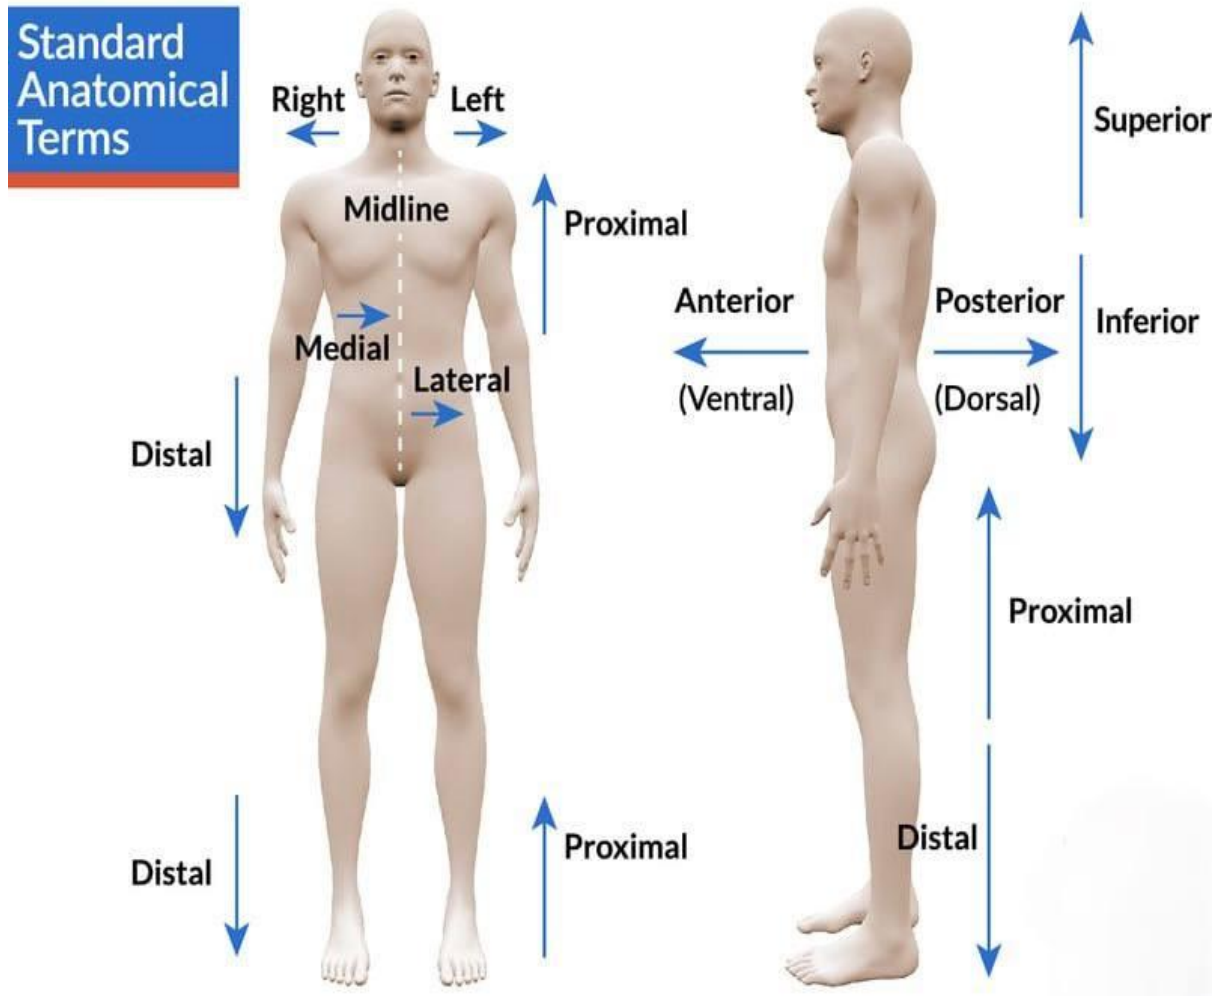

Anatomical planes are imaginary flat surfaces used to divide the human body to describe the locations or directions of internal structures. They are always referenced with the body in the standard anatomical position (standing upright, facing forward, with arms at the sides and palms forward)

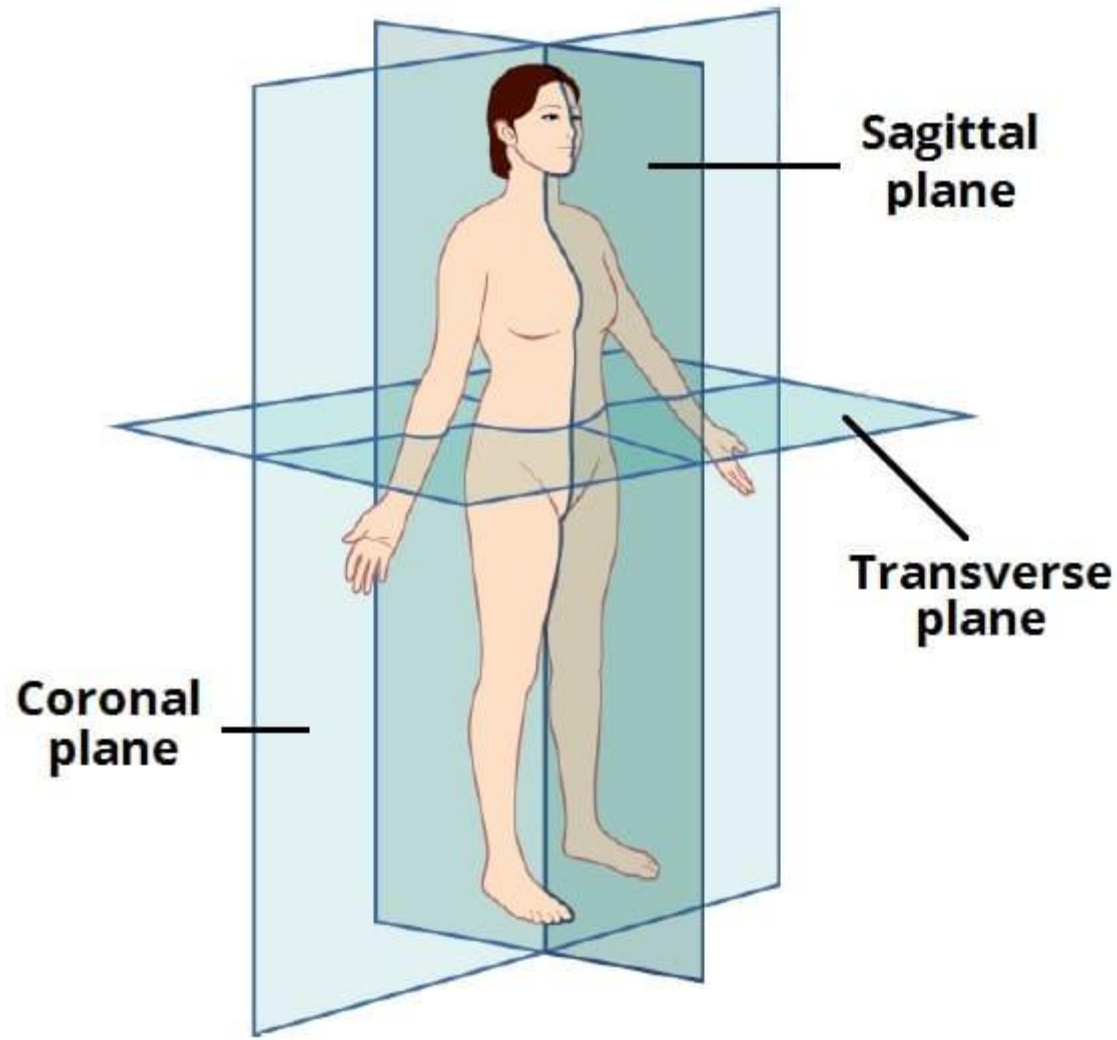

Coronal plane (Frontal Plane) - A vertical plane running from side to side; divides the body or any of its parts into anterior and posterior portions.

Sagittal (Lateral Plane) - A vertical plane running from front to back; divides the body or any of its parts into right and left sides.

Axial Plane (transverse) - A horizontal plane; divides the body or any of its parts into upper and lower parts.

Median plane - Sagittal plane through the midline of the body; divides the body or any of its parts into right and left halves.
